ABSTRACT

The object is to obtain an imaging lens system having an entire lens system downsized, being excellent in portability, and being compatible with a large number of pixels by which a favorable image quality is provided. Provided is an imaging lens system for forming an optical image of an object on a light receiving surface of a solid-state image sensor, comprising, in order from an object side, an aperture diaphragm (100), a first lens element (101) having a positive optical power and a convex surface on an image side, a second lens element (102) having a negative optical power and being a meniscus lens whose object side has a concave shape, and a third lens element (103) having a positive optical power and being a meniscus lens whose object side has a convex shape, in which the following conditional expressions are satisfied:

$$1.9 < |fd/f2d| < 3.5$$

$$0.9 < |fd/f3d| < 2.0$$

$$-2.5 < (r_{201}+r_{202})/(r_{201}-r_{202}) < -1.4$$

$$-1.7 < (r_{301}+r_{302})/(r_{301}-r_{302}) < -1.0$$
